One number that rings all your phones

A number you can provide – **that rings only when you want it to**. Google Voice allows you to text (SMS) from a **full keyboard at the computer**, or from an app on your device. It rings multiple phones, following you as you move from place to place, as you set it up. **Voicemail is transcribed** and texted or emailed to your account, allowing you to think before you provide an answer.

Why would I want a Google Voice number?

- GV will provide a number to give students, where the instructor sets all the rules.
- Students often prefer to send a text over a voice call, office visit, or even email.
- Conference calls are made easy with Google Voice, even if your office doesn't offer them.
- Google Voice allows you to screen calls, just like that old answering machine
- You can make calls directly from a computer, or from the app.
- Want a special number? Google Voice allows you to search for a specific number, or port in a number from a cell phone.
- GV allows you to block calls after 9pm to that number, yet still allows callers who have the direct number.
- If you use a web page, you can install a Widget on the web page and allow people to call you from that web page, all with those privacy settings.
- Need to record a call? It is a matter of pressing "4" while in a Google Voice call!
